

Dry Loose avalanches near Cooke

Date

Sat, 03/15/2025 - 18:00

Today I triggered a D1 dry loose avalanche on a E facing 35 degree slope, 9300 ft on Mt Henderson. The new snow is very low density and is not bonding well to the old interface. I also observed some more dry loose activity/small wind slabs on Sheep Mt, NE facing, 10400 ft.

Region

Cooke City

Location (from list)

Henderson Mountain

Observer Name

Jake Mundt
